Ameer Shaikh

Java Developer

PENDING CERTIFICATION

ABOUT ME

I am a Computer Science Engineering graduate and a Java Full Stack Developer with hands-on experience in building scalable and secure applications using Core & Advanced Java, Spring Boot, Hibernate, Servlets, REST APIs, and relational databases like MySQL and Oracle. Through internships at Revature and KodNest, I strengthened my understanding of MVC architecture, clean coding practices, unit testing (90%+ coverage in projects), and backend system design. I enjoy designing efficient business logic, optimizing database interactions, and writing maintainable code that solves real-world problems.

Beyond backend development, I also have experience working with CI/CD pipelines, Docker, Jenkins, Kubernetes, and cloud deployment practices through my AI-DevOps training. My projects — including a role-based job portal (RevHire) and an automated trading & analytics platform — reflect my interest in building performance-driven and logic-oriented systems. I am a calm, disciplined, and focused individual who approaches challenges with structured planning, analytical thinking, and a continuous learning mindset.

Interesting Facts About Me

- ➢ I actively participate in stock trading, where I apply analytical thinking, risk assessment, and disciplined decision-making.
- ➢ I remain calm and composed under pressure, which helps me solve complex problems effectively.
- ➢ I enjoy exploring music and traveling, as they broaden my perspective and creativity.
- ➢ I have a strong interest in learning about diverse cultures and traditions, which strengthens my adaptability and teamwork skills.
- ➢ I believe in structured planning and consistency, both in my professional projects and personal growth journey.

Education & Certification

Bachelor's Degree - Computer Science and Engineering

maratha mandal Engineering College - Jul 2025

GPA : 7.98

Skill Matrix

Front-end

- HTML5 (6)
- CSS3 (6)
- JavaScript (6)

Back-end

- Java Programming (6)
- OOP's Concepts (6)
- JDBC (6)
- Hibernate (6)
- Spring (6)

Databases

- SQL (6)
- PL/SQL (6)
- Oracle DB (6)
- MYSQL (6)

Front-end

Projects

P1- RevHire

Application Overview

RevHire is a console-based job portal application that connects job seekers with employers. Job seekers can create profiles, build resumes, search for jobs, and apply to positions. Employers can post job openings, manage applications, and shortlist/reject candidates. The application is designed with a modular architecture that can be extended to a microservices-based web application in future phases.

Core Functional Requirements

As a Job Seeker, I should be able to:

1. **Register and create an account** with personal details
2. **Login** to my account
3. **Create and manage textual resume** with structured sections (objective, education, experience, skills, projects)
4. **Search for jobs** using filters (job role, location, experience years, company name, salary range, job type)
5. **Apply for jobs** with one-click using saved resume and optional cover letter (unlimited applications)
6. **View all my applications** with job details and status (Applied/Shortlisted/Rejected/Withdrawn)
7. **Withdraw applications** from jobs with confirmation and optional reason
8. **Manage profile** including education, work experience, skills, and certifications
9. **Receive in-app notifications** for application status updates and job matches

As an Employer, I should be able to:

1. **Register company and create account** with company details (name, industry, size, description, website, location)
2. **Login** using registered credentials
3. **Create job postings** with comprehensive details (title, description, skills, experience, education, location, salary, job type, deadline)
4. **Manage job postings** (view, edit, close/reopen, delete, view statistics)
5. **View applicant details** for each job including profile, resume, and application date
6. **Shortlist or reject applications** with bulk actions, comments, and status updates
7. **Search and filter applicants** by experience, skills, education, and application date
8. **Manage company profile** and update company information

Standard Functional Scope

Authentication & Account Management:

- Register (separate flows for job seekers and employers)
- Login using email and password
- Change password (requires current password)
- Forgotten password recovery through security questions
- Profile completion tracking

Notification System:

- In-app notifications for application status changes, new applications, and job matches

Definition of Done

1. **Working Console Application Demonstration**
2. **Code Repository Submission** with:
    1. ERD Diagram
    2. Application Architecture Diagram

Roles / Responsibilities

- Designed and implemented a **console-based job portal application** using Java and JDBC.
- Defined and structured the **layered architecture** (DAO, Service, Model, UI) to ensure separation of concerns and scalability.
- Designed the **database schema and ER diagram**, including relationships between users, jobs, applications, resumes, and notifications.
- Developed **role-based authentication and authorization** for Job Seekers and Employers.
- Implemented **secure password handling** using SHA-256 hashing and security questions for password recovery.
- Built complete **Job Seeker workflows**, including:
    - Profile management
    - Resume creation and updates
    - Job search and filtering
    - Job application and withdrawal
- Built complete **Employer workflows**, including:

    - Company profile management
    - Job posting and job lifecycle management
    - Viewing, shortlisting, and rejecting applicants
- Implemented an **in-app notification system** for application status updates and employer actions.
- Integrated **JDBC** for database connectivity and optimized SQL queries for CRUD operations.
- Implemented **Log4j2 logging**, configured to log only to files for application monitoring and debugging.
- Followed **SOLID principles** and clean coding practices to improve maintainability.
- Created reusable **utility classes** for database connection management and hashing.
- Performed **manual and unit testing** using JUnit to validate core functionalities.
- Used **Git** for version control and project tracking.
- Prepared project documentation including **README, ERD, and architecture overview**.
- Ensured the application is **extensible** for future migration to a web-based or microservices architecture.

Environment / Technologies

Java, MySQL, JUnit, Git, Log4J, JDBC

P2 - RevHire

Application Overview

RevHire is a full-stack monolithic web application that serves as a job portal connecting job seekers with employers. Job seekers can create profiles, build and upload resumes, search for jobs using advanced filters, and track their applications. Employers can post job openings, manage applications, and shortlist/reject candidates. The application features a responsive web interface, role-based access control, and real-time notifications for enhanced user experience.

Core Functional Requirements

As a Job Seeker, I should be able to:

1. Register and create an account with personal details (name, email, phone, location, current employment status)
2. Login to my account using email and password
3. Create and manage textual resume with structured sections (objective, education, experience, skills, projects, certifications)
4. Upload formatted resume (PDF/DOCX format, max 2MB)
5. Search for jobs using filters (job role, location, experience years, company name, salary range, job type, date posted)
6. Apply for jobs with one-click using saved resume and optional cover letter (unlimited applications)
7. View all my applications with job details and status (Applied/Under Review/Shortlisted/Rejected/Withdrawn)
8. Withdraw applications from jobs with confirmation dialog and optional reason
9. Manage profile including education, work experience, skills, and certifications
10. Receive in-app notifications for application status updates and job recommendations
11. Save jobs to favourites for later application
12. View detailed job descriptions and company profiles

As an Employer, I should be able to:

1. Register company and create account with company details (name, industry, size, description, website, location)
2. Login using registered credentials
3. Create job postings with comprehensive details (title, description, skills, experience, education, location, salary, job type, deadline, number of openings)
4. Manage job postings (view, edit, close/reopen, delete, mark as filled, view statistics)
5. View applicant details for each job including profile, resume (textual and uploaded), cover letter, and application date
6. Shortlist or reject applications with bulk actions, optional comments, and status updates
7. Search and filter applicants by experience, skills, education, application date, and status
8. Manage company profile and update company information
9. View dashboard with statistics (total jobs, active jobs, total applications, pending reviews)
10. Add notes to applications for internal tracking

Standard Functional Scope

- Authentication & Account Management
- Notification System
- User Interface & Experience
- Data Management

Definition of Done

1. Working Web Application Demonstration
2. Code Repository Submission with:
    1. ERD (Entity Relationship Diagram)
    2. Application Architecture Diagram
    3. README.md
    4. Testing Artifacts

Roles / Responsibilities

- Designed and developed a full-stack monolithic job portal web application connecting job seekers and employers.
- Implemented secure authentication and role-based access control for Job Seeker and Employer roles.
- Developed complete registration and login workflows with password encryption and validation.
- Designed and implemented RESTful APIs for job posting, job applications, resume management, and notifications.
- Built advanced job search functionality with dynamic filters (role, location, experience, salary, company, job type, date posted).
- Developed job application workflow including apply, withdraw, shortlist, reject, and status tracking.

- Implemented resume upload feature with file validation (PDF/DOCX, max 2MB).
- Designed structured resume management system with sections (education, experience, skills, projects, certifications).
- Built Employer dashboard with statistics (total jobs, active jobs, total applications, pending reviews).
- Developed real-time/in-app notification system for application updates and job recommendations.
- Designed normalized database schema and created Entity Relationship Diagram (ERD).
- Established relationships between Users, Companies, Jobs, Applications, Resumes, Notifications, and Notes.
- Implemented exception handling, input validation, and error management across the application.
- Built responsive user interface using HTML, CSS, and Bootstrap ensuring cross-device compatibility.
- Integrated frontend with backend APIs and ensured smooth end-to-end data flow.
- Performed unit testing and functional testing to validate core features.
- Managed version control and maintained well-structured, documented code repository.
- Prepared application architecture diagram and complete project documentation (README.md).
- Successfully demonstrated the working web application as per the defined scope and requirements.

Environment / Technologies

Java, SQL, Git, Spring Boot, JUnit4, Log4J, Maven
